InstaSPIN –BLDC Details

www.ti.com/instaspin-blbc

InstaSPIN™-BLDC

- Low cost, Sensorless Control of BLDC/PMSM motors
- BEMF Voltage technique without issues of BEMF Zero Cross Detection!
- Robust start-up
- Robust during acceleration / deceleration
- Forward and Reverse control
- Capable of much lower and higher speeds
- More noise resistant

The InstaSPIN-BLDC Advantage

Robust!

InstaSPIN has currently been tested on about 80 different motors. In each case, the motor was running in under 30 seconds, and suitably tuned in under two minutes.

Simple!

Only one parameter needs to be adjusted to tune the commutation process.

Better High Speed!

Commutation by dynamically lowering the threshold level.

More Reliable Low Speed!

Back-EMF integration creates a less noisy signal for commutation control.

Adapts to Acceleration Changes!

unlike the zero-cross timing technique

Most Common Sensorless Technique: Zero Cross

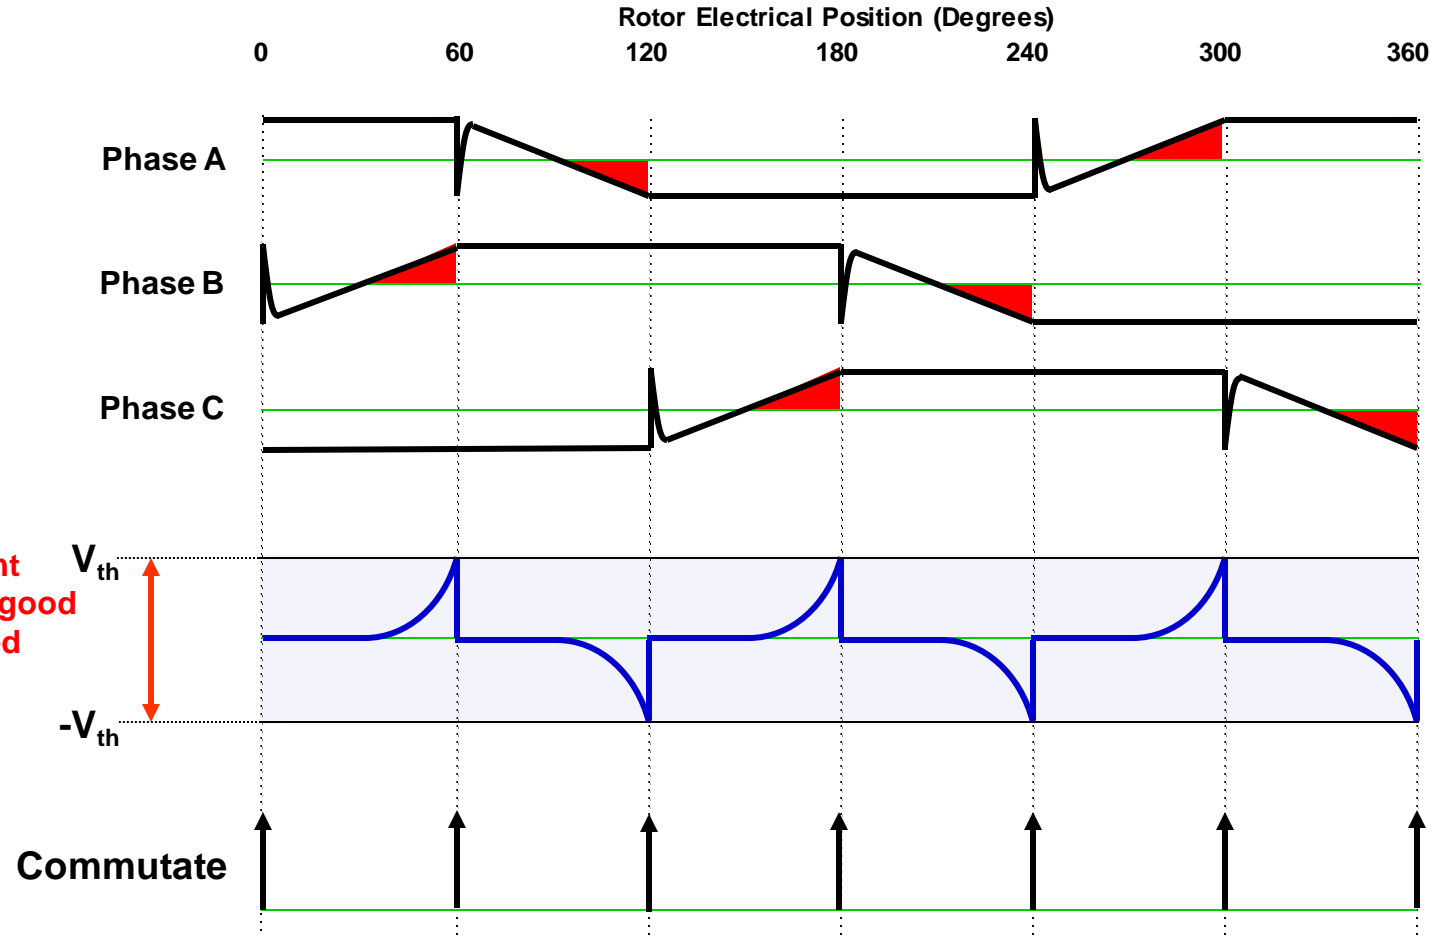

Zero crossings

Requires Timing

Uses past info as future, hence poor during speed and load changes

InstaSPIN - BLDC...A Peek Under the Hood

No Timing

Adjustable
threshold
voltage

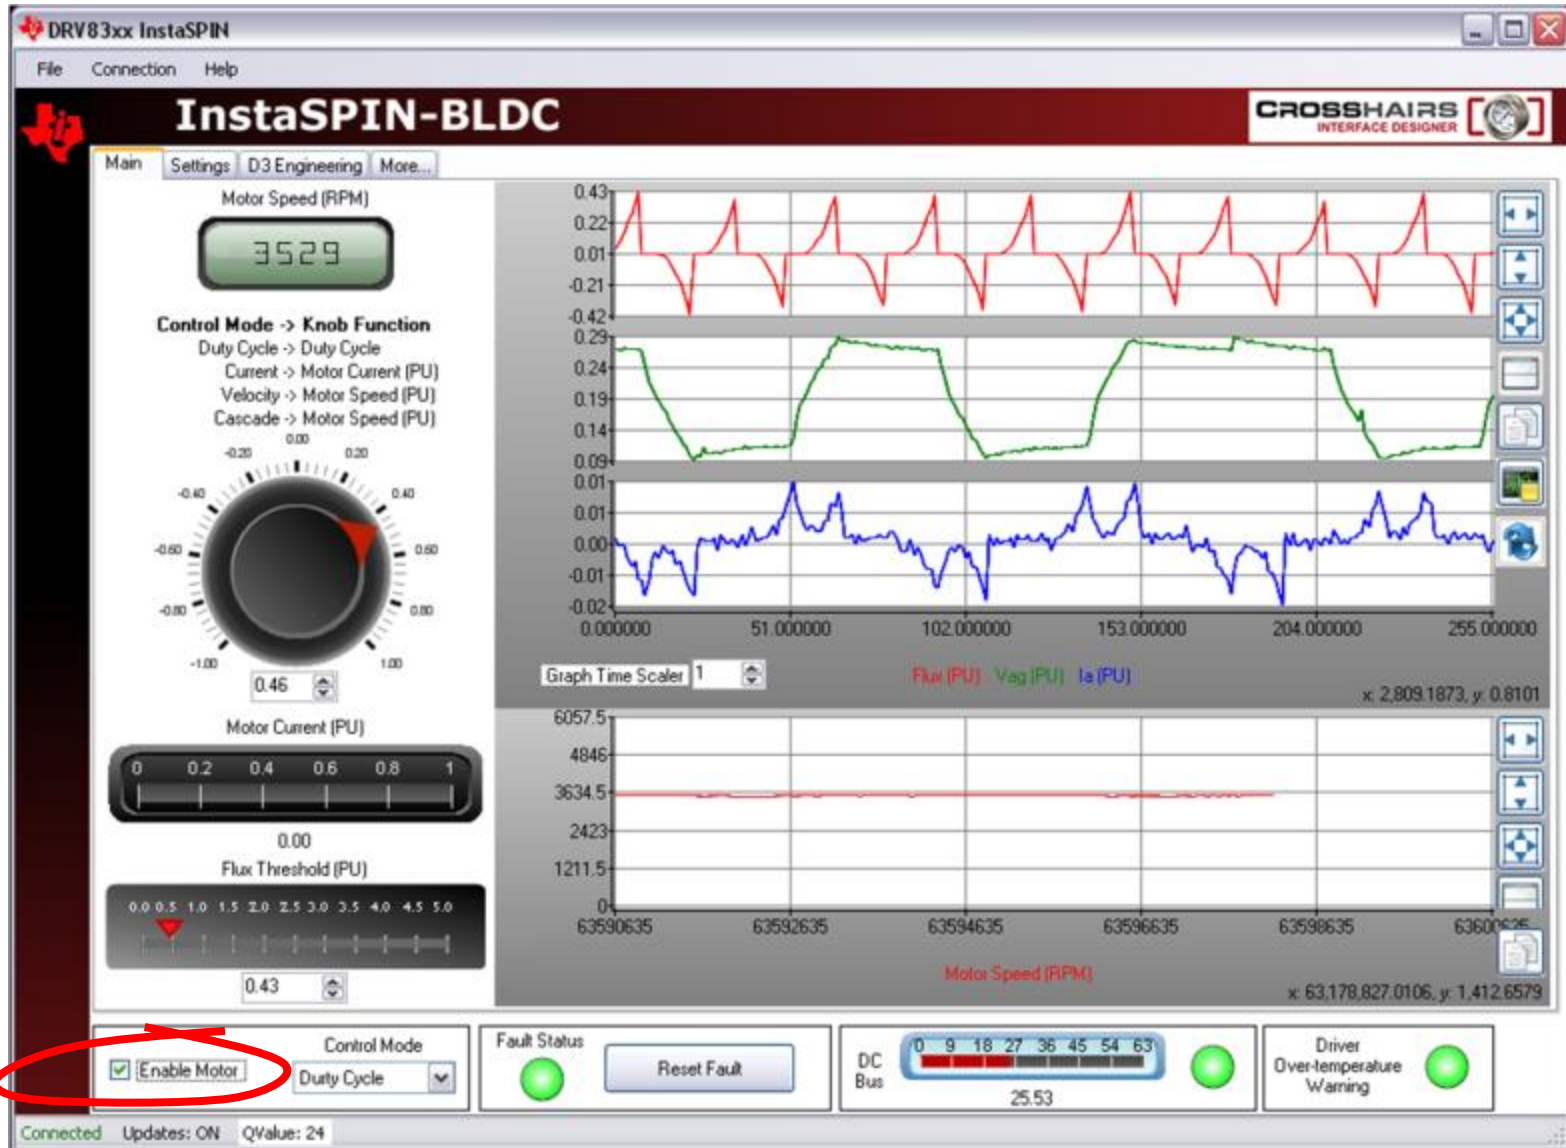

Uses present
info, hence good
during speed
and load
changes

Speed Invariant Performance

$$voltage = \frac{d\lambda}{dt}$$

Spin & Tune with GUI

Closed Loop with GUI

The screenshot displays the InstaSPIN-BLDC software interface. The main window is titled "InstaSPIN™-BLDC" and includes a menu bar with "File", "Connection", and "Help". The interface is divided into several sections:

- Startup Control:** Contains sliders for "Startup Duty Cycle" (0.00 to 0.30) and "Startup Ramp Time (ms)" (0 to 1000). It also includes input fields for "Ramp Start Speed" and "Ramp End Speed" in RPM, and checkboxes for "Advanced Startup Options".
- Current Loop:** Features a gain knob for K_p (0.00 to 5.00) and a gain knob for K_i (0 to 2000). Below these is a "Startup Current (PU)" slider (0.00 to 1.00).
- Velocity Loop:** Features a gain knob for K_p (0.00 to 5.00) and a gain knob for K_i (0 to 2000). Below these is a "Velocity Loop Limit (PU)" slider (0.00 to 1.00).
- Motor Parameters:** Includes a "Pole Count" dropdown menu (set to "4 Poles") and a "Base Electrical Frequency (Hz)" input field.
- Control Mode:** A dropdown menu is set to "Cascade".
- Status Indicators:** A "DC Bus" meter shows a value of 24, and a "Driver Over-temperature Warning" indicator is present.

Red circles highlight the "Current Loop" and "Velocity Loop" sections, and the "Control Mode" dropdown menu.

Current Loop parameters are only active when Control Mode is set to Current or Cascade.

Velocity Loop parameters are only active when Control Mode is set to Velocity or Cascade.

In Velocity Control Mode the Velocity Loop Limit slider sets the maximum PWM duty cycle to the motor.

In Cascade Control Mode the Velocity Loop Limit slider sets the maximum current to the motor.

Disconnected Updates: OFF QValue: 24

InstaSPIN –FOC Details

www.ti.com/instaspin-foc

FOC & Sensorless Challenges

FOC requires precise position knowledge of **rotor magnetic field** to create appropriate **stator magnetic field**, oriented to produce maximum torque.

1. Costly sensor (encoder/resolver)

- Mechanical alignment
- Not necessarily magnetic unless “absolute”

2. Complex software algorithms (model observers)

- + Lower cost and no repair or replacement
- + Can be used where sensors can't be
- Not appropriate for FOC with position control

TI's new FAST software sensor is Superior

- + Works with synchronous & asynchronous motors
- + Model relies on fewer motor parameters
 - + Optional start-up parameter ID tool
 - + Optional run-time parameter tracking
- + Observer requires no tuning
- + More accurate, more dynamically robust
- + Stable at and through zero speed
- + Stall recovery
- + Better at start-up under load
- + Parameters used to set FOC current controllers
- + Highest fidelity feedback signals
- / + Proprietary technique, no source given

InstaSPIN™-FOC with FAST

simplify design of a **sensorless torque** controller

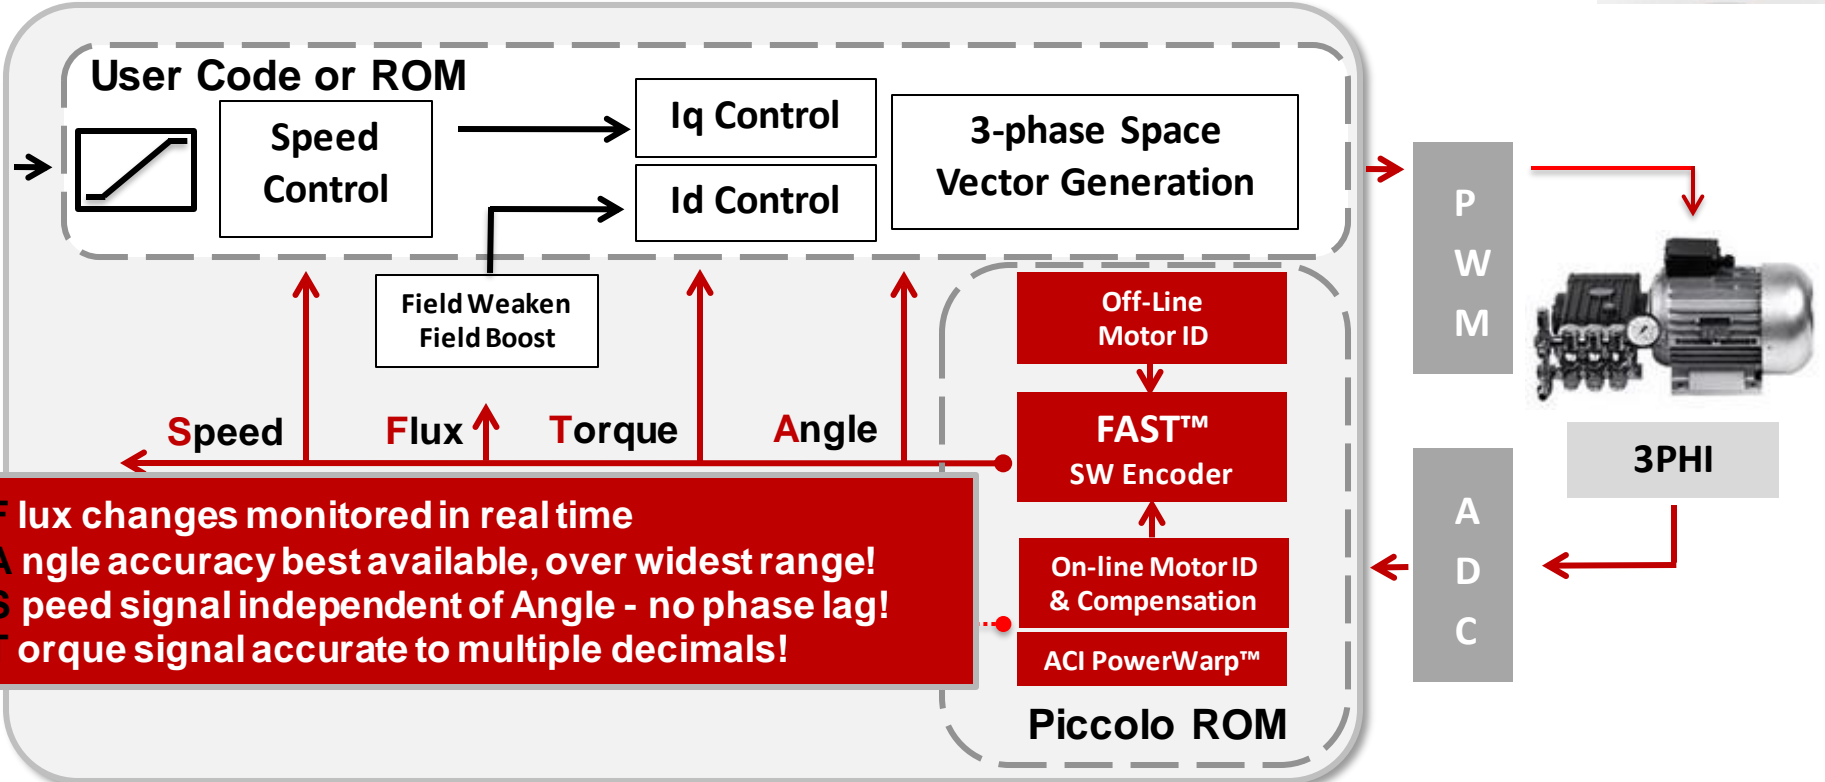

“simple”
| Motion

“starting”
| Speed Control

| Torque Control

| Inverter Switching

Flux changes monitored in real time
Ange accuracy best available, over widest range!
Speed signal independent of Angle - no phase lag!
Torque signal accurate to multiple decimals!

| Feedback

Full load start-up features, 100% duty cycle, stable at and through 0 speed, four quadrant

InstaSPIN™-FOC: FAST™ replaces rotor sensor or software observer techniques of the past

Dramatically reduce challenges of sensorless FOC system development

- Motor parameters identified
- No tuning of FAST required (vs. other algos)
- Current loop automatically tuned
- Speed loop set for evaluation
- “Instant” stable system to start development
- Run-time parameter compensation
- Modes & features for common system challenges: start-up, at & through zero speed, field weakening, high modulation, PowerWarp™ for induction motors

Easy to use flexible software architecture

- Novice can call full system from ROM adjusting control gains
- Expert can fully customize control system calling only FAST from ROM

Benefit from high fidelity, low latency feedback signals

- **F**lux signal for field weakening / boosting
- **A**ngle accuracy over widest range
- **S**peed of rotor with near zero phase lag
- **T**orque signal is high bandwidth and high accuracy, enabling monitoring and control of loads and flows

TI's InstaSPIN™ - enabled real-time controllers

TI's [InstaSPIN three-phase motor control solutions](#) are enabled by special libraries in the read-only memory (ROM) of Piccolo microcontrollers (MCUs) that allow you to create products with improved efficiency, performance, and reliability, while reducing development time from months to minutes. TI's InstaSPIN-enabled MCUs provide expertise to designers of sensorless (velocity and torque) or sensed (position, velocity and torque) motor control applications.

FAST Algorithm Performance

- ◆ Field orientation converges within first electrical cycle
- ◆ Works on all three phase motors
- ◆ Zero speed start-up operation at full torque
- ◆ Fast torque response, negligible torque ripple
- ◆ Stable across all corners in all quadrants
- ◆ Angle accuracy within +/-1 count of a 1024 encoder steady state
- ◆ Stall recovery without losing field orientation
- ◆ Includes automatic current loop tuning and Motor Commissioning
- ◆ ACI PowerWarp™: 80% energy savings vs. Triac, 45% vs. FOC
 - ◆ Real-world data from 200W 1400RPM Industrial Fan in-field installation

Identify, tune, and run best sensorless FOC available in minutes

Quick Start Guide

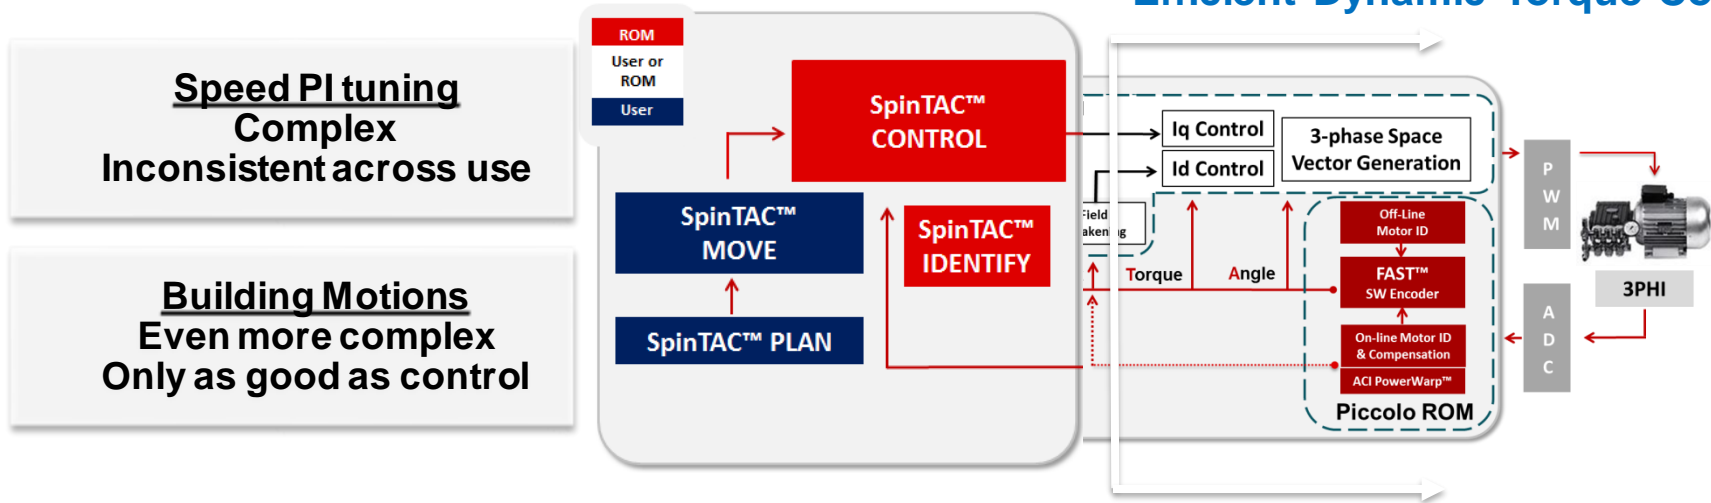

InstaSPIN™ –MOTION Details

www.ti.com/instaspin-motion

InstaSPIN-FOC to InstaSPIN-MOTION for velocity control

InstaSPIN-FOC provides
Efficient Dynamic Torque Control

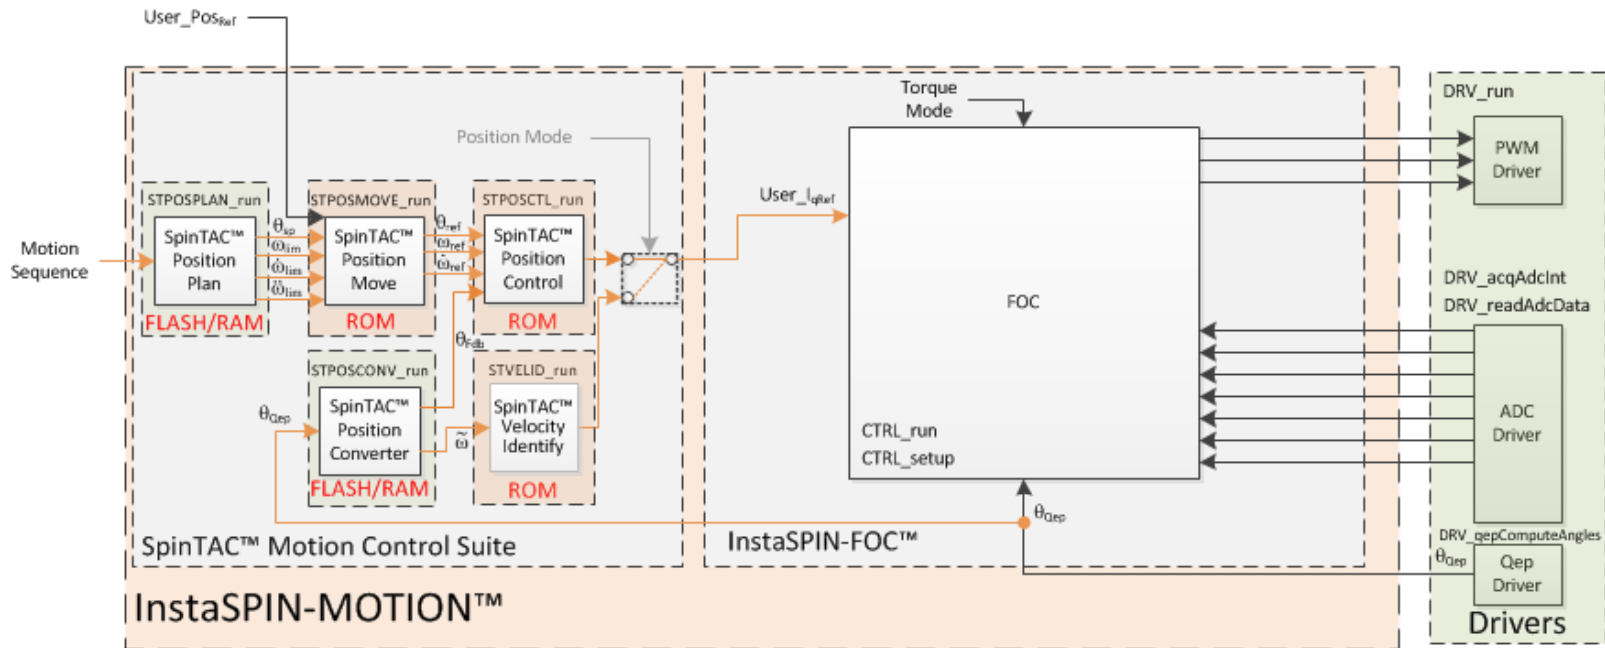

InstaSPIN-MOTION SpinTAC™ suite

- Builds upon InstaSPIN-FOC (or use with sensors)
- IDENTIFY: system inertia identification for enhanced feedback into controller
- CONTROL: single variable controller replaces PI and typically works across system conditions
- MOVE: generation of Speed A to Speed B with various trajectories (trap, S-curve, ST-curve)
- PLAN: logic-based execution of different MOVES

InstaSPIN-FOC Speed Control

- Initial PI gains are just a first starting point
- Does not incorporate real inertia of system
- Control requires
 - Tuning of 2-variable PI controller
 - “gain staging”, different sets of tuning at various operating points
- Movements/ Trajectories
 - Only offers constant fixed acceleration

InstaSPIN-MOTION for Position Control

InstaSPIN-MOTION Position Solution

- Requires the use of a sensor
- **CONVERTER:** puts encoder feedback into mechanical units
- **IDENTIFY:** system inertia identification for enhanced feedback into controller
- **CONTROL:** single variable controller replaces PI position & velocity loops and typically works across system conditions
- **MOVE:** generation of Position A to Position B with various trajectories (trap, S-curve, ST-curve)
- **PLAN:** logic-based execution of different MOVES

Key Benefits

- Single Parameter Tuning of **BOTH** Position & Velocity loops
- Disturbance rejecting controller
- Quiet zero position hold
- Great performance at ultra low speeds
- Jerk controlled ideal position changes

SpinTAC™ Components

Account for mechanical inertia - Robust speed control - Simplified tuning

Identify:

Measure Inertia

- Inertia is important for accurate control
- Short acceleration test to identify system inertia

Control:

Maximum control, minimum effort

- ◆ Disturbance-rejecting controller
- ◆ Single variable to tune response
- ◆ Typically effective across full variable speed and load range

Run

Estimate Motor Inertia

Your motor will spin a few times as SpinTAC estimates the motor inertia

Status

Zero Speed

[rad/s]

SpinTAC™ Components

Integrated Movement and Motion Design

Move: Build Trajectories

- ◆ Select Motion Type for Speed **A** to **B**
- ◆ Define constraints (accel, jerk)
- ◆ Move generates the ideal curve

Plan: Design Motion Sequence

- Define operating states and transitions
- Connect logic-based Moves
- Execute the motion sequence

The Solution: InstaSPIN™-MOTION

Simplifies design, Improves performance

Robust speed control with compensation for the real mechanics of the system

- **IDENTIFY:** System inertia identification used as input for the most accurate control
- **CONTROL:** SpinTAC™ replaces standard PI and provides more accurate performance across the full operating range through real-time disturbance estimation and cancellation

Simple Tuning

- 1-variable “gain” allows for simple, instant tuning
- Eliminates gain staging – single tuning is effective over the ENTIRE operating range

Easy motion design

- **MOVE:** Motion engine calculates the ideal reference signal (with feed forward) based on user-defined parameters. Supports standard industry curves, and LineStream’s proprietary “smooth trajectory” curve
- **PLAN:** Motion Sequence Planner operates user-defined state transition maps

InstaSPIN-MOTION GUI

Step 1 – Estimate Inertia

Motor Identification | Speed or Torque | Speed Profiles | **SpinTAC 1:Startup** | SpinTAC 2:Tuning | SpinTAC 3:Motion | Advanced: Field Control

 Version: 2 . 1 . 15

SpinTAC is a **High-Performance Controller** that replaces PI control

It uses advanced control techniques and is **Tuned with one parameter** In a matter of minutes

You only have to tune it once and SpinTAC performs across a **Wide Operating Range**

To begin, *check the limits and click "Estimate Motor Inertia"* when SpinTAC is Enabled, move the tab "SpinTAC 2: Tuning".

1 Limits

Motor Ready

Iq Limit: [A]
0 < ≤

Speed: [RPM]
0 < ≤

2 Results

Your motor will spin a few times as SpinTAC estimates the motor inertia

Status

Lab 2b (Motor ID from RAM/FLASH)

- ◆ Call the API functions to set up the sensorless FOC system.
- ◆ Setup the user.h file for the motor and inverter.
- ◆ Start the automatic motor parameter estimation.
- ◆ Update user.h for your motor.
- ◆ Lab Procedure
 - View Lab 2a procedure in Instaspin_labs.pdf
(C:\ti\MotorWare\motorware_1_01_00_16\docs\labs\Instaspin_labs.pdf)

Motor Identification Parameters

- ◆ USER_MOTOR_TYPE
 - MOTOR_Type_Pm -> PMSM
 - MOTOR_Type_Induction -> AC Induction
- ◆ USER_MOTOR_NUM_POLE_PAIRS
 - Number of magnetic poles/2
- ◆ USER_MOTOR_RES_EST_CURRENT
 - Current used to measure the resistance (R_s) of the motor
 - R_s measurement requires a park start
 - Current used to start the motor during identification
 - Use higher values if the motor is loaded or has high cogging torque
- ◆ USER_MOTOR_IND_EST_CURRENT
 - Negative current setting used to measure the total inductance (L_s) of the motor
 - The magnitude will change the result of the L_s measurement. Determines where on the hysteresis curve L_s is measured.

Motor Identification Parameters

- ◆ USER_MOTOR_MAX_CURRENT
 - Maximum peak motor current
 - Equals maximum total current $\sqrt{I_q + I_d}$
- ◆ USER_MOTOR_FLUX_EST_FREQ_Hz
 - Electrical frequency that the motor is spun at during identification
 - Make higher if identification fails

USER_IQ_FULL_SCALE_FREQ_HZ

- ◆ The maximum electrical frequency of the currents and voltages that the motor will operate at.
 - Set 20%-30% higher than the highest motor electrical frequency for headroom.

USER_ADC_FULL_SCALE_VOLTAGE_V

- ◆ Hardware dependent full scale voltage with respect to the maximum voltage of the A/D being used.

$$\text{USER_ADC_FULL_SCALE_VOLTAGE_V} = \frac{R_{Vl} + R_{Vu}}{R_{Vl}} \cdot V_{\text{adc_max}}$$

- ◆ $V_{\text{adc_max}}$ – A/D's maximum voltage (i.e. 3.3V)

USER_IQ_FULL_SCALE_VOLTAGE_V

- ◆ User selectable voltage scaling.
- ◆ Defines full scale value for the IQ30 variable of Voltage inside the system. All voltages are converted into (pu) based on the ratio to this value.
 - This value **MUST** be larger than the maximum value of any voltage calculated inside the estimator system otherwise the value can saturate and roll-over, causing an inaccurate value.
 - This value is **OFTEN** greater than the maximum measured ADC value, especially with high B_{emf} motors operating at higher than rated speeds.
 - If the motor is operated at multiples of its base voltage, in field weakening, then USER_IQ_FULL_SCALE_VOLTAGE_V must be increased.

USER_ADC_FULL_SCALE_CURRENT_A

- ◆ Hardware dependent full scale current with respect to the maximum A/D voltage.

$$\text{USER_ADC_FULL_SCALE_CURRENT_A} = \frac{V_{\text{adc_max}}}{R_S \cdot G}$$

- ◆ $V_{\text{adc_max}}$ – A/D's maximum voltage (i.e. 3.3V)

USER_IQ_FULL_SCALE_CURRENT_A

- ◆ User selectable current scaling.
- ◆ All currents are converted into (pu) based on the ratio to this value.

–Prevent roll-over by keeping this value greater than half of USER_ADC_FULL_SCALE_CURRENT_A.

USER_NUM_CURRENT_SENSORS

- ◆ Chooses the number of shunts available for current measurement.
 - Options are either 2 or 3.

USER_NUM_VOLTAGE_SENSORS

- ◆ Defines the number of voltage sensors
 - Must be 3

USER_PWM_FREQ_kHz

- ◆ Defines the Pulse Width Modulation (PWM) frequency in kHz.
 - The PWM frequency can be very large but care must be taken to allow enough time for the main ISR to be finished.

USER_VOLTAGE_FILTER_POLE_Hz

- ◆ Defines the analog voltage filter pole location in Hz.

$$\text{USER_VOLTAGE_FILTER_POLE_Hz} = \frac{C_v}{R_{vl}^{-1} + R_{vu}^{-1}} \cdot \frac{1}{2\pi}$$

ADC Routing

◆ **void HAL_setupAdcs(HAL_Handle handle) in hal.c**

–Set the channel number to sample and convert

```
ADC_setSocChanNumber(obj->adcHandle, ADC_SocNumber_1, ADC_SocChanNumber_A3);
```

–Set the start of conversion trigger

```
ADC_setSocTrigSrc(obj->adcHandle, ADC_SocNumber_1, ADC_SocTrigSrc_EPWM4_ADCSOCA);
```

–Set the number of cycles to sample

```
ADC_setSocSampleDelay(obj->adcHandle, ADC_SocNumber_1, ADC_SocSampleDelay_9_cycles);
```

ADC Polarity

◆ **static inline void HAL_readAdcData(HAL_Handle handle, HAL_AdcData_t *pAdcData) in hal.h**

– Positive polarity for op-amp feedback

– Negative polarity for op-amp feedback

ADC Polarity change in hal.h

- ◆ Positive polarity for x = 0, 1, and 2

- “value” must be positive

- “bias” must be +=

```
pAdcData->l.value[x] = value;
```

```
bias += OFFSET_getOffset(obj->offsetHandle_l[cnt]);
```

- ◆ Negative polarity for x = 0, 1, and 2

- “value” must be negative

- “bias” must be -=

```
pAdcData->l.value[x] = -value;
```

```
bias -= OFFSET_getOffset(obj->offsetHandle_l[cnt]);
```

Thank you
